Background:	Synonyms: CC125_HUMAN, CCDC125, Coiled-coil domain-containing protein 125, KENAE,y
	Protein kenae.
	Background: CCDC125, also known as KENAE, is a 511 amino acid protein expressed as two
	isoforms produced by alternative splicing and encoded by a gene mapping to human
	chromosome 5. With 181 million base pairs encoding around 1,000 genes, chromosome 5 is
	about 6 % of human genomic DNA. It is associated with Cockayne syndrome through the
	ERCC8 gene and familial adenomatous polyposis through the adenomatous polyposis coli
	(APC) tumor suppressor gene. Treacher Collins syndrome is also chromosome 5 associated
	and is caused by insertions or deletions within the TCOF1 gene. Deletion of the p arm of
	chromosome 5 leads to Cri du chat syndrome. Deletion of 5q or chromosome 5 altogether is
	common in therapy-related acute myelogenous leukemias and myelodysplastic syndrome.
