	Background: Required for assembly of dynein regulatory complex (DRC) and inner dynein arm
	complexes, which are responsible for ciliary beat regulation, thereby playing a central role in
	motility in cilia and flagella. Not required for outer dynein arm complexes assembly. Tissue
	specificity:Mainly expressed in nasal brushings and, to a lesser extent, in lungs and
	testis.Involvement in disease:Defects in CCDC39 are the cause of primary ciliary dyskinesia
	type 14 (CILD14) . A disorder characterized by abnormalities of motile cilia. Respiratory
	infections leading to chronic inflammation and bronchiectasis are recurrent, due to defects in
	the respiratory cilia, reduced fertility is often observed in male patients due to abnormalities of
	sperm tails. Half of the patients exhibit randomization of left-right body asymmetry and situs
	inversus, due to dysfunction of monocilia at the embryonic node. Primary ciliary dyskinesia
	associated with situs inversus is referred to as Kartagener syndrome.
