domain containing 40, Coiled-coil domain-containing protein 40.
Background: Required for assembly of dynein regulatory complex (DRC) and inner dynein arm
complexes, which are responsible for ciliary beat regulation, thereby playing a central role in
motility in cilia and flagella. Not required for outer dynein arm complexes assembly. Required
for axonemal recruitment of CCDC39.Involvement in disease:Defects in CCDC40 are the cause
of primary ciliary dyskinesia type 15 (CILD15) . A disorder characterized by abnormalities of
motile cilia. Respiratory infections leading to chronic inflammation and bronchiectasis are
recurrent, due to defects in the respiratory cilia, reduced fertility is often observed in male
patients due to abnormalities of sperm tails. Half of the patients exhibit randomization of left-
right body asymmetry and situs inversus, due to dysfunction of monocilia at the embryonic
node. Primary ciliary dyskinesia associated with situs inversus is referred to as Kartagener
syndrome.
