Background:	Synonyms: Coiled-coil domain containing 54, FLJ25362, NYD-SP17, Testes development-	
	related NYD-SP17, Testis development protein NYD-SP17.	
	Background: The specific function of CCDC54 (coiled-coil domain containing 54) is not yet	
	known. The CCDC54 gene appears to be conserved in chimpanzee, dog, mouse, and	
	rat.CCDC54, also known as coiled-coil domain-containing protein 54 or testis development	
	protein NYD-SP17, is a 328 amino acid protein that is phosphorylated on threonine 182 during	
	post-translational modification. The gene encoding NYD-SP17 maps to human chromosome	
	3q13.12 and mouse chromosome 16 B5. Human chromosome 3 houses over 1,100 genes,	
	including a chemokine receptor (CKR) gene cluster and a variety of human cancer-related gene	
	loci. Key tumor suppressing genes on chromosome 3 include those that encode the apoptosis	
	mediator RASSF1, the cell migration regulator HYAL1 and the angiogenesis suppressor	
	SEMA3B. Marfan Syndrome, porphyria, von Hippel-Lindau syndrome, osteogenesis imperfecta	
	and Charcot-Marie-Tooth disease are a few of the numerous genetic diseases associated with	
	chromosome 3.
