Background: The coiled-coil domain is a structural motif found in proteins that are involved in a	
diverse array of biological functions such as the regulation of gene expression, cell division,	
membrane fusion and drug extrusion and delivery. CCDC58 (coiled-coil domain containing 58)	
is a 144 amino acid protein that is encoded by a gene that maps to human chromosome	
3q21.1. Chromosome 3 is made up of about 214 million bases encoding over 1,100 genes.	
Notably, there is a chemokine receptor gene cluster and a variety of human cancer related loci	
on chromosome 3. Particular regions of the chromosome 3 short arm are deleted in many	
types of cancer cells. Key tumor suppressing genes on chromosome 3 encode apoptosis	
mediator RASSF1, cell migration regulator HYAL1 and angiogenesis suppressor SEMA3B.	
Marfan Syndrome, porphyria, von Hippel-Lindau syndrome, osteogenesis imperfecta and	
Charcot-Marie-Tooth Disease are a few of the numerous genetic diseases associated with	
chromosome 3.
