Background: KIR3DL1 (NKB1, CD158e1) is expressed on a subset of natural killer cells and T
cells. NKB1 is a 70 kD member of the immunoglobulin superfamily that is expressed at varying
levels among individuals. NKB1 is a type I membrane protein containing two immunoglobulin
C2 type domains. The interaction of NKB1 with specific HLA B antigens on a target cell (the
HLA Bw4 allele, for example) inhibits cytotoxicity and prevents target cell lysis and death. The
interactions between KIR and MHC class I are thought to be important in NK and T cell
regulation following antigen stimulation. The absence of ligands for KIRs may lower the
threshold for activation through activating receptors and increase inflammation and
susceptibility to autoimmune disease.
