	Galactosyltransferase-associated protein kinase p58/GTA, PITSLRE serine/threonine-protein
	kinase CDC2L1.
	Background: Summary: This gene encodes a member of the p34Cdc2 protein kinase family.
	p34Cdc2 kinase family members are known to be essential for eukaryotic cell cycle control.
	This gene is in close proximity to CDC2L2, a nearly identical gene in the same chromosomal
	region. The gene loci including this gene, CDC2L2, as well as metalloprotease MMP21/22,
	consist of two identical, tandemly linked genomic regions which are thought to be a part of the
	larger region that has been duplicated. This gene and CDC2L2 were shown to be deleted or
	altered frequently in neuroblastoma with amplified MYCN genes. The protein kinase encoded
	by this gene could be cleaved by caspases and was demonstrated to play roles in cell
	apoptosis. Several alternatively spliced variants of this gene have been reported. [provided by
