Target Details		
Background:	Synonyms: BPF, CETP, CETP_HUMAN, Cholesteryl ester transfer, Cholesteryl ester transfer	
	protein, Cholesteryl ester transfer protein plasma, Cholesteryl ester transfer protein precursor,	
	HDLCQ10, Lipid transfer protein I.	
	Background: High density lipoproteins (HDLs) have been proposed to function jointly with	
	lecithin:cholesterol acyltransferase and CETP to facilitate cholesterol transport from tissues to	
	the liver. This mechanism, referred to as reverse cholesterol transport, is physiologically	
	important because it maintains systemic cholesterol levels. CETP is responsible for neutral lipid	
	transfer activity in plasma in numerous species. Since CETP is able to accelerate specifically	
	the exchange of lipid components between pro- and anti-atherogenic lipoprotein fractions, it	
	may be a key determinant of the global atherogenicity of the plasma lipoprotein profile and	
	arises as a possible target in atherosclerosis prevention. CETP has an important role in reverse	
	cholesterol transport and shaping and affecting the composition of plasma lipoproteins. In	
	general elevated levels of CETP have been associated with increased risk of coronary heart	
	disease.
