	Background: Probable core component of the endosomal sorting required for transport
	complex III (ESCRT-III) which is involved in multivesicular bodies (MVBs) formation and sorting
	of endosomal cargo proteins into MVBs. MVBs contain intraluminal vesicles (ILVs) that are
	generated by invagination and scission from the limiting membrane of the endosome and
	mostly are delivered to lysosomes enabling degradation of membrane proteins, such as
	stimulated growth factor receptors, lysosomal enzymes and lipids. The MVB pathway appears
	to require the sequential function of ESCRT-O, -I,-II and -III complexes. ESCRT-III proteins mostly
	dissociate from the invaginating membrane before the ILV is released. The ESCRT machinery
	also functions in topologically equivalent membrane fission events, such as the terminal stages
	of cytokinesis and the budding of enveloped viruses (HIV-1 and other lentiviruses).
