Background:	Synonyms: BNF1, Breast tumor novel factor 1, CHL2, chordin like 2, Chordin like protein 2
	precursor, Chordin related protein 2, CRDL2_HUMAN.
	Background: CHRDL2 is a novel chordin like protein that can act as a BMP antagonist.
	Amember of the chordin family of proteins, it contains a signal peptide andthree CR (cysteine-
	rich repeat) domains. When expressed as a recombinantprotein it is secreted and binds to
	activin A, but not to BMP-2, -4, -6. Differential expression has been detected in developing
	chondrocytes, myoblasts, osteoblasts, and osteoarthritic joints. Complex alternative splicing of
	CHRDL2 potentially results in distinct isoforms that differ at their C termini, in the expression of
	signal peptide, and in the content of CR domains. CHRDL2 was originally characterized as a
	novel protein exclusively expressed in breast, lung, and colon tumors.
