| | Thrombin activatable fibrinolysis inhibitor. | |
| | Background: This protein belongs to a family of Zn-containing metallocarboxypeptidases | |
| | specific to C-terminal lysine and arginine residues. It circulates in plasma as a zymogen with | |
| | molecular weight of 55 kDa (401 amino acid residues, pl 5.0). Being activated by thrombin- | |
| | thrombomodulin complex during blood coagulation, it exerts carboxypeptidase activity. | |
| | Activated carboxypeptidase B2 removes C-terminal lysine residues from fibrin, which is | |
| | necessary for plasminogen binding to fibrin. This prevents plasminogen from activation into | |
| | plasmin and retards the lysis of a fibrin clot. The concentration in plasma of healthy people is 5- | |
| | 10 μ g/mL. High plasma levels were found in patients with stable angina pectoris and | |
| | angiographically verified coronary artery disease. Elevated concentration in blood is considered | |
| | as a risk factor for venous thrombosis. A deficiency might contribute to the severity of bleeding | |
| | disorders in hemophilias A and B, and decreased levels are found in chronic liver disease. | |
