Background:	Synonyms: DOC2, DOC-2, Disabled homolog 2, Differentially-expressed protein 2, DAB2	
	Background: This gene encodes a mitogen-responsive phosphoprotein. It is expressed in	
	normal ovarian epithelial cells, but is down-regulated or absent from ovarian carcinoma cell	
	lines, suggesting its role as a tumor suppressor. This protein binds to the SH3 domains of	
	GRB2, an adaptor protein that couples tyrosine kinase receptors to SOS (a guanine nucleotide	
	exchange factor for Ras), via its C-terminal proline-rich sequences, and may thus modulate	
	growth factor/Ras pathways by competing with SOS for binding to GRB2. Alternatively spliced	
	transcript variants encoding different isoforms have been found for this gene. [provided by
