	Background: The X and Y chromosomes are the human sex chromosomes. Chromosome X
	consists of about 153 million base pairs and nearly 1,000 genes. The combination of an X and Y
	chromosome lead to normal male development while two copies of X lead to normal female
	development. There are a number of conditions related to an unsual number and combination
	of sex chromosomes being inherited. More than one copy of the X chromosome with a Y
	chromosome causes Klinefelter's syndrome. A single copy of X alone leads to Turner's
	syndrome. More than 2 copies of the X chromosome, in the absence of a Y chromosome, is
	known as Triple X syndrome. Color blindness, hemophilia, and Duchenne muscular dystrophy
	are well known X chromosome-linked conditions which affect males more frequently as males
	carry a single X chromosome. The FAM104B gene product has been provisionally designated
	FAM104B pending further characterization.
