Target Details		
Background:	Synonyms: Protein FAM134C, FAM134C	
	Background: Chromosome 17 makes up over 2.5 % of the human genome with about 81 million	
	bases encoding over 1,200 genes. Two key tumor suppressor genes are associated with	
	chromosome 17, namely, p53 and BRCA1. Tumor suppressor p53 is necessary for	
	maintenance of cellular genetic integrity by moderating cell fate through DNA repair versus cell	
	death. Malfunction or loss of p53 expression is associated with malignant cell growth and Li-	
	Fraumeni syndrome. Like p53, BRCA1 is directly involved in DNA repair, though specifically it is	
	recognized as a genetic determinant of early onset breast cancer and predisposition to cancers	
	of the ovary, colon, prostate gland and fallopian tubes. Chromosome 17 is also linked to	
	neurofibromatosis, a condition characterized by neural and epidermal lesions, and dysregulated	
	Schwann cell growth. Alexander disease, Birt-Hogg-Dube syndrome and Canavan disease are	
	also associated with chromosome 17. The FAM134C gene product has been provisionally designated FAM134C pending further characterization.
