	Background: The protein encoded by this gene is a member of the fibroblast growth factor		
	(FGF) family. FGF family members possess broad mitogenic and cell survival activities and are		
	involved in a variety of biological processes including embryonic development, cell growth,		
	morphogenesis, tissue repair, tumor growth and invasion. This gene was identified by its		
	oncogenic transforming activity. This gene and FGF3, another oncogenic growth factor, are		
	located closely on chromosome 11. Co-amplification of both genes was found in various kinds		
	of human tumors. Studies on the mouse homolog suggested a function in bone		
	morphogenesis and limb development through the sonic hedgehog (SHH) signaling pathway.		
	[provided by RefSeq].		
Gene ID:	2249		
Pathways:	RTK Signaling, Fc-epsilon Receptor Signaling Pathway, EGFR Signaling Pathway, Neurotrophin		
	Signaling Pathway, Stem Cell Maintenance
