	Background: The minichromosome maintenance protein 3 (MCM3) is one of the MCM proteins
	essential for the initiation of DNA replication. The protein encoded by this gene is a MCM3
	binding protein. It was reported to have phosphorylation-dependent DNA-primase activity,
	which was up-regulated in antigen immunization induced germinal center. This protein was
	demonstrated to be an acetyltransferase that acetylates MCM3 and plays a role in DNA
	replication. The mutagenesis of a nuclear localization signal of MCM3 affects the binding of
	this protein with MCM3, suggesting that this protein may also facilitate MCM3 nuclear
	localization.
