inducer of neurite outgrowth 2, GPRIN2, GRIN2, GRIN2_HUMAN, MGC15171, mKIAA0514,
RGD1308922.
Background: G protein-coupled receptors (GPCRs) represent a large superfamily of cell-surface
receptors that are involved in a multitude of physiological processes such as perception of
sensory information, modulation of synaptic transmission, hormone release/actions, regulation
of cell contraction/migration and cell growth/differentiation. GPCRs interact with G proteins
(heterotrimeric GTPases) to synthesize intracellular second messengers, such as
diacylglycerol, cyclic AMP, inositol phosphates and calcium ions. Their diverse biological
functions range from vision and olfaction to neuronal and endocrine signaling and are involved
in many pathological conditions. GRIN2 (G protein-regulated inducer of neurite outgrowth 2),
also known as GPRIN2, is a 458 amino acid protein that is expressed in cerebellum and is
thought to play a role in neurite outgrowth. GRIN2 interacts with activated G?oand G?, and is
encoded by a gene that maps to human chromosome 10q11.22.
