	GLYG2_HUMAN.
	Background: This gene encodes a member of the the glycogenin family. Glycogenin is a self-
	glucosylating protein involved in the initiation reactions of glycogen biosynthesis. A gene on
	chromosome 3 encodes the muscle glycogenin and this X-linked gene encodes the glycogenin
	mainly present in liver, both are involved in blood glucose homeostasis. This gene has a short
	version on chromosome Y, which is 3' truncated and can not make a functional protein. Multiple
	alternatively spliced transcript variants encoding different isoforms have been identified.
