Background:	Synonyms: Interleukin-11, Adipogenesis inhibitory factor, AG, IL 11, IL11, Interleukin 11,	
	Oprelvekin, IL11_HUMAN.	
	Background: Interleukin 11 is a pleiotropic cytokine produced by mesenchymal-derived	
	adherent cells. IL11 shares many functions of IL6 and LIF, including potentiation of	
	megakaryocyte activity, enhancement of human myeloma cell proliferation, and enhancement	
	of hepatic acute phase protein production. Interleukin 11 directly stimulates the proliferation of	
	hematopoietic stem cells and megakaryocyte progenitor cells, and induces megakaryocyte	
	maturation resulting in increased platelet production. Clinically it is used to prevent severe	
	thrombocytopenia and the reduction of the need for platelet transfusion following	
	myelosuppressive chemotherapy.
