| Background: | Synonyms: Interleukin-11, Adipogenesis inhibitory factor, AG, IL 11, IL11, Interleukin 11, |
| | Oprelvekin, IL11_HUMAN. |
| | Background: Interleukin 11 is a pleiotropic cytokine produced by mesenchymal-derived |
| | adherent cells. IL11 shares many functions of IL6 and LIF, including potentiation of |
| | megakaryocyte activity, enhancement of human myeloma cell proliferation, and enhancement |
| | of hepatic acute phase protein production.Interleukin 11 directly stimulates the proliferation of |
| | hematopoietic stem cells and megakaryocyte progenitor cells, and induces megakaryocyte |
| | maturation resulting in increased platelet production. Clinically it is used to prevent severe |
| | thrombocytopenia and the reduction of the need for platelet transfusion following |
| | myelosuppressive chemotherapy. |
