Target Details

•	
Background:	Synonyms: Interleukin-5 receptor alpha, CD125 antigen, CDw125, HSIL5R3, IL5R, IL-5R,
	Interleukin 5 Receptor alpha, Interleukin 5 receptor subunit alpha, interleukin 5 receptor type 3,
	MGC26560, IL5RA, IL-5R alpha, IL5RA_HUMAN.
	Background: The protein encoded by this gene is an interleukin 5 specific subunit of a
	heterodimeric cytokine receptor. The receptor is comprised of a ligand specific alpha subunit
	and a signal transducing beta subunit shared by the receptors for interleukin 3(IL3), colony
	stimulating factor 2 (CSF2/GM-CSF), and interleukin 5(IL5). The binding of this protein to IL5
	depends on the beta subunit. The beta subunit is activated by the ligand binding, and is required
	for the biological activities of IL5. This protein has been found to interact with syndecan binding
	protein (syntenin), which is required for IL5 mediated activation of the transcription factor
	SOX4. Six alternatively spliced transcript variants encoding three distinct isoforms have been
	reported.
