|                     | Background: The JNK-interacting protein (JIP) group of scaffold proteins selectively mediates     |
|                     | JNK signaling by aggregating specific components of the MAPK cascade to form a functional         |
|                     | JNK signaling module. Required for JNK activation in response to excitotoxic stress.              |
|                     | Cytoplasmic MAPK8IP1 causes inhibition of JNK-regulated activity by retaining JNK in the          |
|                     | cytoplasm and inhibiting JNK phosphorylation of c-Jun. May also participate in ApoER2-            |

|                     | function. Appears to have a role in cell signaling in mature and developing nerve terminals. May  |
|                     | function as a regulator of vesicle transport, through interactions with the JNK-signaling         |
