	Background: Kallikreins are a subgroup of serine proteases having diverse physiological
	functions. Growing evidence suggests that many kallikreins are implicated in carcinogenesis
	and some have potential as novel cancer and other disease biomarkers. This gene is one of the
	fifteen kallikrein subfamily members located in a cluster on chromosome 19. Expression of this
	gene is regulated by steroid hormones and may be useful as a marker for breast cancer. An
	additional transcript variant has been identified, but its full length sequence has not been
	determined. [provided by RefSeq, Jul 2008].
