	Background: The protein encoded by this gene is a member of the S100 family of proteins
	containing 2 EF-hand calcium-binding motifs. S100 proteins are localized in the cytoplasm
	and/or nucleus of a wide range of cells, and involved in the regulation of a number of cellular
	processes such as cell cycle progression and differentiation. S100 genes include at least 13
	members which are located as a cluster on chromosome 1q21. This protein may function in
	the inhibition of casein kinase and as a cytokine. Altered expression of this protein is associated
	with the disease cystic fibrosis. [provided by RefSeq].
