	respiratory chain complex I 18 KD subunit, NADH dehydrogenase, NADH ubiquinone
	oxidoreductase 18 kDa subunit, NDUS4_HUMAN.
	Background: This gene encodes an accessory subunit of the mitochondrial membrane
	respiratory chain NADH dehydrogenase (Complex I), or NADH:ubiquinone oxidoreductase, the
	first multi-subunit enzyme complex of the mitochondrial respiratory chain. Complex I plays a
	vital role in cellular ATP production, the primary source of energy for many crucial processes in
	living cells. It removes electrons from NADH and passes them by a series of different protein-
	coupled redox centers to the electron acceptor ubiquinone. In well-coupled mitochondria, the
	electron flux leads to ATP generation via the building of a proton gradient across the inner
	membrane. Complex I is composed of at least 41 subunits, of which 7 are encoded by the
	mitochondrial genome and the remainder by nuclear genes. [provided by RefSeq, Jul 2008].
