Background:	Synonyms: Leucine rich repeat containing 4C, Leucine-rich repeat-containing protein 4C,
	LRC4C_HUMAN, Lrrc4C, Netrin-G1 ligand, NGL 1, NGL-1, NGL1.
	Background: NGL-1 is a single pass type I membrane protein that acts as a cell adhesion
	molecule. It contains nine leucine-rich repeats (LRR) and one Ig-like C2-type domain. NGL-1 is
	predominantly expressed in the striatum and the cerebral cortex of both the embryonic and
	adult brain. NGL-1 specifically interacts with Netrin G1 (a molecule involved in axon guidance in
	the developing central nervous system) via its LRR region. NGL-1 plays a role in the regulation
	of neurite outgrowth of developing thalamic neurons. Soluble NGL-1 inhibits thalamic axon
	outgrowth while NGL-1 that is bound to the surface of developing thalamocortical axons
	stimulates growth. NGL-1 also interacts with Whirlin possibly stablizing interstereociliar links.
