Background: Synonyms: hPARP3, IRT1, NAD+ ADP ribosyltransferase 3, pADPRT 3, Poly[ADP ribose] synthetase 3, ADP ribosyltransferase NAD+, poly ADP ribose, ADPRT-3, ADPRT3, ADPRTL2, ADPRTL3, hPARP 3, hPARP-3, IRT 1, IRT1, NAD+ ADP-ribosyltransferase 3, NAD+ ADP ribosyltransferase 3, pADPRT-3, pADPRT3, PARP 3, PARP-3, PARP3, Poly ADP ribose polymerase family, member 3, Poly ADP ribose synthetase 3, Poly [ADP-ribose] polymerase 3, Poly[ADP-ribose] synthase 3.

Background: Involved in the base excision repair (BER) pathway, by catalyzing the poly(ADP-ribose)ation of a limited number of acceptor proteins involved in chromatin architecture and in DNA metabolism. This modification follows DNA damages and appears as an obligatory step in a detection/signaling pathway leading to the reparation of DNA strand breaks. May link the DNA damage surveillance network to the mitotic fidelity checkpoint. Negatively influences the G1/S cell cycle progression without interfering with centrosome duplication. Binds DNA. May be involved in the regulation of PRC2 and PRC3 complex-dependent gene silencing. Tissue specificity: Widely expressed, the highest levels are in the kidney, skeletal muscle, liver, heart and spleen, also detected in pancreas, lung, placenta, brain, leukocytes, colon, small intestine, ovary, testis, prostate and thymus.
