	LIM domain protein 3.
	Background: The protein encoded by this gene contains a PDZ domain and a LIM domain,
	indicating that it may be involved in cytoskeletal assembly. In support of this, the encoded
	protein has been shown to bind the spectrin-like repeats of alpha-actinin-2 and to colocalize
	with alpha-actinin-2 at the Z lines of skeletal muscle. Alternatively spliced transcript variants
	encoding multiple isoforms have been observed for this gene. Aberrant alternative splicing of
	this gene may play a role in myotonic dystrophy.
