	Background: The protein encoded by this gene is a transcriptional coactivator that regulates the
	genes involved in energy metabolism. This protein interacts with PPARgamma, which permits
	the interaction of this protein with multiple transcription factors. This protein can interact with,
	and regulate the activities of, cAMP response element binding protein (CREB) and nuclear
	respiratory factors (NRFs). It provides a direct link between external physiological stimuli and
	the regulation of mitochondrial biogenesis, and is a major factor that regulates muscle fiber
	type determination. This protein may be also involved in controlling blood pressure, regulating
	cellular cholesterol homoeostasis, and the development of obesity. [provided by RefSeq].
