| | precursor. |
| | Background: Control of cell signaling via SHP-1 is thought to occur through a balance between |
| | PILRalpha-mediated inhibition and PILRbeta-mediated activation. These paired |
| | immunoglobulin-like receptor genes are located in a tandem head-to-tail orientation on |
| | chromosome 7. PILRB is the non-ITIM-bearing member of the receptor pair, which has a |
| | truncated cytoplasmic tail relative to its ITIM-bearing partner and functions in the activating |
| | role. There are three named isoforms produced by alternative splicing. |
