	Background: Serine protease that proteolytically cleaves and activates the viral spike	
	glycoproteins which facilitate virus-cell membrane fusions, spike proteins are synthesized and	
	maintained in precursor intermediate folding states and proteolysis permits the refolding and	
	energy release required to create stable virus-cell linkages and membrane coalescence.	
	Facilitates human SARS coronavirus (SARS-CoV) infection via two independent mechanisms,	
	proteolytic cleavage of ACE2, which might promote viral uptake, and cleavage of coronavirus	
	spike glycoprotein which activates the glycoprotein for cathepsin L-independent host cell entry.	
	Proteolytically cleaves and activates the spike glycoproteins of human coronavirus 229E	
	(HCoV-229E) and human coronavirus EMC (HCoV-EMC) and the fusion glycoproteins F0 of	
	Sendai virus (SeV), human metapneumovirus (HMPV), human parainfluenza 1, 2, 3, 4a and 4b	
	viruses (HPIV). Essential for spread and pathogenesis of influenza A virus (strains H1N1, H3N2	
	and H7N9), involved in proteolytic cleavage and activation of hemagglutinin (HA) protein which	
	is essential for viral infectivity.
