	Background: SART1 encodes two proteins, the SART1(800) protein expressed in the nucleus of the majority of proliferating cells, and the SART1(259) protein expressed in the cytosol of
	epithelial cancers. The SART1(259) protein is translated by the mechanism of -1 frameshifting
	during posttranscriptional regulation, its full length sequence is not published yet. The two
	encoded proteins are thought to be involved in the regulation of proliferation. Both proteins
	have tumor rejection antigens. The SART1(259) protein possesses tumor epitopes capable of
	inducing HLA-A2402-restricted cytotoxic T lymphocytes in cancer patients. This SART1(259)
	antigen may be useful in specific immunotherapy for cancer patients and may serve as a
	paradigmatic tool for the diagnosis and treatment of patients with atopy. The SART1(259)
	protein is found to be essential for the recruitment of the tri snRNP to the pre spliceosome in
	the spliceosome assembly pathway.
