	Background: SH3KBP1 belongs to the CIN85/CMS family of adaptor molecules, characterized
	by containing three N-terminal Src homology domains, a proline rich region and a C-terminal
	coiled-coil domain. The different members of the family orchestrate a network involved in
	dowregulation and degradation of recpetor tyrosine kinases. SH3KBP1 is involved in regulating
	diverse signal transduction pathways. Involved in the regulation of endocytosis and lysosomal
	degradation of ligand-induced receptor tyrosine kinases, including EGFR and MET/hepatocyte
	growth factor receptor, through a association with CBL and endophilins. In the case of EGF
	receptor turnover, its activation involves recruitment of SH3KBP1- endophilin complexes to
	mediate internalization. Once internalized, RTKs are delivered into the endosomal compartment
	where receptors get sorted for either recycling back to the cell surface or are targeted to
	lysosomes for degradation. Alternate splicing results in multiple transcript variants.
