Background:	Synonyms: ENT4, PMAT, Equilibrative nucleoside transporter 4, hENT4, Plasma membrane
	monoamine transporter, Solute carrier family 29 member 4, SLC29A4, PSEC0113
	Background: Functions as a polyspecific organic cation transporter, efficiently transporting
	many organic cations such as monoamine neurotransmitters 1-methyl-4-phenylpyridinium and
	biogenic amines including serotonin, dopamine, norepinephrine and epinephrine. May play a
	role in regulating central nervous system homeostasis of monoamine neurotransmitters. May
	be involved in luminal transport of organic cations in the kidney and seems to use luminal
	proton gradient to drive organic cation reabsorption. Does not seem to transport nucleoside
	and nucleoside analogs such as uridine, cytidine, thymidine, adenosine, inosine, guanosine, and
	azidothymidine. In (PubMed:16873718) adenosine is efficiently transported but in a fashion
	highly sensitive to extracellular pH , with maximal activity in the pH range 5.5 to 6.5. Glu-206 is
	essential for the cation selectivity and may function as the charge sensor for cationic
	substrates. Transport is chloride and sodium-independent but appears to be sensitive to
	changes in membrane potential. Weakly inhibited by the classical inhibitors of equilibrative
	nucleoside transport, dipyridamole, dilazep, and nitrobenzylthioinosine. May play a role in the
	regulation of extracellular adenosine concentrations in cardiac tissues, in particular during
	ischemia.
