	transporter, Electrogenic sodium monocarboxylate cotransporter, Sodium iodide-related
	cotransporter, Solute carrier family 5 member 8, SLC5A8
	Background: Acts as an electrogenic sodium (Na(+)) and chloride (Cl-)-dependent sodium-
	coupled solute transporter, including transport of monocarboxylates (short-chain fatty acids
	including L-lactate, D-lactate, pyruvate, acetate, propionate, valerate and butyrate), lactate,
	mocarboxylate drugs (nicotinate, benzoate, salicylate and 5-aminosalicylate) and ketone bodies
	(beta-D-hydroxybutyrate, acetoacetate and alpha-ketoisocaproate), with a Na(+):substrate
	stoichiometry of between 4:1 and 2:1. Catalyzes passive carrier mediated diffusion of iodide.
	Mediates iodide transport from the thyrocyte into the colloid lumen through the apical
	membrane. May be responsible for the absorption of D-lactate and monocarboxylate drugs
	from the intestinal tract. Acts as a tumor suppressor, suppressing colony formation in colon
	cancer, prostate cancer and glioma cell lines. May play a critical role in the entry of L-lactate
	and ketone bodies into neurons by a process driven by an electrochemical Na(+) gradient and
	hence contribute to the maintenance of the energy status and function of neurons.
