	Background: Slc9a9 (Sodium/hydrogen exchanger 9) or NHE9 may act in electroneutral
	exchange of protons for Na(+) across membranes. Four isoforms of the Na+/H+ exchanger
	(NHE6-NHE9) are distributed to intracellular compartments in human cells. They are localized
	to Golgi and post-Golgi endocytic compartments as follows: mid- to trans-Golgi, NHE8, trans-
	Golgi network, NHE7, early recycling endosomes, NHE6, and late recycling endosomes, NHE9.
	The intracellular localization of the NHEs is established by the balance of transport in and out o
	the post-Golgi compartments as the dynamic membrane trafficking. Their in vivo function is to
	regulate the pH and monovalent cation concentration in these organelles.
