	Background: Central component of cohesin, a complex required for chromosome cohesion
	during the cell cycle. The cohesin complex may form a large proteinaceous ring within which
	sister chromatids can be trapped. At anaphase, the complex is cleaved and dissociates from
	chromatin, allowing sister chromatids to segregate. Cohesion is coupled to DNA replication and
	is involved in DNA repair. The cohesin complex plays also an important role in spindle pole
	assembly during mitosis and in chromosomes movement.
