Background:	Synonyms: MOB, MOB1, SMS1, TMEM23, hmob33, Phosphatidylcholine:ceramide	
	cholinephosphotransferase 1, Medulla oblongata-derived protein, Protein Mob, Sphingomyelin	
	synthase 1, Transmembrane protein 23, SGMS1	
	Background: Sphingomyelin synthases synthesize the sphingolipid, sphingomyelin, through	
	transfer of the phosphatidyl head group, phosphatidylcholine, on to the primary hydroxyl of	
	ceramide. The reaction is bidirectional depending on the respective levels of the sphingolipid	
	and ceramide. Golgi apparatus SMS1 directly and specifically recognizes the choline head	
	group on the substrate, requiring two fatty chains on the choline-P donor molecule in order to	
	be recognized efficiently as a substrate. Major form in macrophages. Required for cell growth ir	
	certain cell types such as HeLa cells. Suppresses BAX-mediated apoptosis and also prevents	
	cell death in response to stimuli such as hydrogen peroxide, osmotic stress, elevated	
	temperature and exogenously supplied sphingolipids. May protect against cell death by	
	reversing the stress-inducible increase in levels of proapoptotic ceramide.
