| | Background: Synapsin II is a member of the synapsin gene family. Synapsins are neuronal | | |
| | phosphoproteins which associate with the cytoplasmic surface of synaptic vesicles. Family | | |
| | members are characterized by common protein domains, and they are implicated in | | |
| | synaptogenesis and the modulation of neurotransmitter release, suggesting a potential role in | | |
| | several neuropsychiatric diseases. This member of the synapsin family is a neuron-specific | | |
| | phosphoprotein that selectively binds to small synaptic vesicles in the presynaptic nerve | | |
| | terminal. | | |
