	Background: Contactin 2 is a neuronal cell adhesion molecule (CAM) that influences the	
	formation of axon connections in the developing nervous system. Contactin 2 is a member of	
	the immunoglobulin superfamily (IgSF) and contains a glycosylphosphatidylinositol-anchor, six	
	immunogobulin (Ig)-like and four Fibronectin type III (FNIII)-like domains. Contactin 2 is	
	expressed predominantly during neural development on the cell membrane of axons in nerve	
	fiber tracts in order to guide commissural axons without promoting their growth. Contactin 2	
	binds with NgCAM in the plane of the same membrane (cis-binding). The Contactin 2	
	heterophilic (Contactin 2/NgCAM and Contactin 2/NrCAM) binding sites are localized to the	
	first four Ig domains. The Contactin 2 homophilic (Contactin 2/Contactin 2) binding site is	
	localized to the FNIII domain.
