Target Details

Background:	Synonyms: Uncharacterized protein C9orf172, C9orf172
	Background: TAP is an integral transmembrane protein involved in the transport of antigens
	from the cytoplasm to the endoplasmic reticulum for association with MHC class I molecules.
	It is a heterodimer of TAP1 and TAP2, and the peptide-binding site is shared between the
	cytoplasmic loops of TAP1 and TAP2. TAP is inducible by interferon gamma and belongs to the
	ABC transporter family, MDR subfamily. TAP also acts as a molecular scaffold for the final
	stage of MHC class I folding, namely the binding of peptide. Nascent MHC class I molecules
	associate with TAP via tapasin. TAP is inhibited by the covalent attachment of herpes simplex
	virus ICP47 protein, which blocks the peptide-binding site of TAP. It is inhibited by human
	cytomegalovirus US6 glycoprotein, which binds to the lumenal side of the TAP complex and
	inhibits peptide translocation by specifically blocking ATP-binding to TAP and prevents the
	conformational rearrangement of TAP induced by peptide binding.
