Background:	Synonyms: TF-1 cell apoptsis-related gene 19, Programmed cell death protein 5, TF-1 cell
	apoptosis-related protein 19, Protein TFAR19, PDCD5.
	Background: This gene encodes a protein expressed in tumor cells during apoptosis
	independent of the apoptosis-inducing stimuli. Prior to apoptosis induction, this gene product is
	distributed in both the nucleus and cytoplasm. Once apoptosis is induced, the level of this
	protein increases and by relocation from the cytoplasm, it accumulates in the nucleus.
	Although its exact function is not defined, this protein is thought to play an early and universal
	role in apoptosis.
Gene ID:	9141
