	VAV2_HUMAN.
	Background: VAV2 is a ubiquitously expressed structural homolog of the VAV protooncogene
	that is expressed preferentially in hematopoetic cells. Both proteins are comprised of a Dbl
	homology (DH) domain with guanosine nucleotide exchange (GEF) activity exclusively directed
	towards Rho/Rac GTPases, a pleckstrin homology (PH) domain, a calponin-homology (CH)
	region, an acidic domain (AD) a zinc finger butterfly motif, two SH3 regions and one SH2
	domain. GEF activity of RhoA family G proteins is induced by tyrosine phosphorylation in wild
	type VAV2, and is constitutively activated in N terminus deleted oncogene forms. Constitutive
	expression of a VAV2 oncoprotein may result in morphological alterations including highly
	enlarged cells in which karyokinesis and cytokinesis frequently are uncoupled.
Gene ID:	7410

Pathways:

Fc-epsilon Receptor Signaling Pathway, Neurotrophin Signaling Pathway
