Background:	Synonyms: ChREBP, bHLHd14, Carbohydrate responsive element binding protein, MIO, MLX
	interacting protein like, MIx interactor, MLXIPL, MONDOB, WBSCR 14, WBSCR14, Williams

	protein, WS basic helix loop helix leucine zipper protein, WS bHLH, MLXPL_HUMAN.
	Background: ChREBP (Carbohydrate responsive element binding protein) is a transcription
	factor playing a critical role in the nutrient and hormonal regulation of genes encoding enzymes
	of glucose metabolism and lipogenesis pathways. It contains several domains including a
	nuclear localization signal (NLS) near the N-terminus, polyproline domains, a basic helix-loop-
	helix leucine zipper (b/HLH/Zip) and a leucine zipper like (zip-like) domain.ChREBP is
	ubiquitously detected in various tissues, with highest expression in liver, kidney and white and
	brown adipose tissue. Under basal conditions ChREBP is localized in the cytosol, translocating
	into the nucleus upon high glucose stimulation following its dephosphorylation of serine 196.
Gene ID:	51085
Pathways:	Carbohydrate Homeostasis, Regulation of Carbohydrate Metabolic Process
