79, WRAP53, WDR79/TCAB1, WAP53_HUMAN.		
Background: WDR79 contains six WD (tryptophan-aspartate) repeat domains found in a		
number of proteins that function as adaptor molecules in signal transduction and cytoskeletal		
organization. The WD repeat is defined by four or more repeating units of a conserved core of		
approximately 40 amino acids ending with tryptophan-aspartic acid (WD). WD repeats may		
serve as sites of protein-protein interaction for adaptor proteins and facilitate multiprotein		
complex formation. The function of the WDR79 protein has not been characterized, however		
significant and consistent single nucleotide polymorphisms in the WDR79 gene have been		
found to be associated with ER negative breast cancer.
