| | 79, WRAP53, WDR79/TCAB1, WAP53_HUMAN. Background: WDR79 contains six WD (tryptophan-aspartate) repeat domains found in a number of proteins that function as adaptor molecules in signal transduction and cytoskeletal | | |
| | | | |
| | | | |
| | organization. The WD repeat is defined by four or more repeating units of a conserved core of | | |
| | approximately 40 amino acids ending with tryptophan-aspartic acid (WD). WD repeats may | | |
| | serve as sites of protein-protein interaction for adaptor proteins and facilitate multiprotein | | |
| | complex formation. The function of the WDR79 protein has not been characterized, however | | |
| | significant and consistent single nucleotide polymorphisms in the WDR79 gene have been | | |
| | found to be associated with ER negative breast cancer. | | |
