Target Details

Background: CSRP2 is a protein containing two LIM domains, which are double zinc finger motifs found in proteins of diverse function. CSRP2 and some related proteins are thought to act as protein adapters, bridging two or more proteins to form a larger protein complex. The protein encoded by this gene binds to one of the LIM domains of CSRP2 and contains an acetyltransferase domain. Although the encoded protein has been detected in the cytoplasm, it is predominantly a nuclear protein. Two transcript variants encoding different isoforms have been found for this gene. Synonyms: Monoclonal CSRP2BP antibody, Anti-CSRP2BP antibody, Cysteine rich protein 2 binding protein antibody, CRP2BP antibody, PRO1194 antibody, MGC15388 antibody, dJ717M23.1 antibody.
