RNA helicases. They are implicated in a number of cellular processes involving alteration of
RNA secondary structure such as translation initiation, nuclear and mitochondrial splicing, and
ribosome and spliceosome assembly. Based on their distribution patterns, some members of
this family are believed to be involved in embryogenesis, spermatogenesis, and cellular growth
and division. This gene encodes a DEAD box protein, which is an enzyme that possesses both
ATPase and DNA helicase activities. This gene is a homolog of the yeast CHL1 gene, and may
function to maintain chromosome transmission fidelity and genome stability. Alternative
splicing results in multiple transcript variants encoding distinct isoforms.Synonyms: CHL1,
