Target Details

Background:	CD19 Molecule,CD19 is a transmembrane glycoprotein of Ig superfamily expressed by B cells
	from the time of heavy chain rearrangement until plasma cell differentiation. It forms a
	tetrameric complex with CD21 (complement receptor type 2), CD81 (TAPA-1) and Leu13.
	Together with BCR (B cell antigen receptor), this complex signals to decrease B cell treshold for
	activation by the antigen. Besides being signal-amplifying coreceptor for BCR, CD19 can also
	signal independently of BCR coligation and it turns out to be a central regulatory component
	upon which multiple signaling pathways converge. Mutation of the CD19 gene results in
	hypogammaglobulinemia, whereas CD19 overexpression causes B cell hyperactivity.,B4, Leu-
