## Target Details

Target:	PSMB8
Alternative Name:	PSMB8 (PSMB8 Products)
Background:	Description: The proteasome is a multicatalytic proteinase complex with a highly ordered ring-
	shaped 20S core structure. The core structure is composed of 4 rings of 28 non-identical
	subunits, 2 rings are composed of 7 alpha subunits and 2 rings are composed of 7 beta
	subunits. Proteasomes are distributed throughout eukaryotic cells at a high concentration and
	cleave peptides in an ATP/ubiquitin-dependent process in a non-lysosomal pathway. An

	essential function of a modified proteasome, the immunoproteasome, is the processing of
	class I MHC peptides. This gene encodes a member of the proteasome B-type family, also
	known as the T1B family, that is a 20S core beta subunit. This gene is located in the class II
	region of the MHC (major histocompatibility complex). Expression of this gene is induced by
	gamma interferon and this gene product replaces catalytic subunit 3 (proteasome beta 5
	subunit) in the immunoproteasome. Proteolytic processing is required to generate a mature
	subunit. Two alternative transcripts encoding two isoforms have been identified, both isoforms
	are processed to yield the same mature subunit.
